

This ATR file holds the complete flash re-programming code to upgrade the TK-II's PIC16F1847 chip using the JOY2PIC programmer hardware. It is an auto loading file, and should be run with no DOS support or BASIC cartridge inserted. So if you have something like the Ultimate 1 Meg upgrade, be sure to disable the built-in SDX before attempting to boot from this file.

JOY2PIC is a small programming board that connects to joystick 1, and which through the use of Daniel Serpell's excellent Atari-to-PIC software program, will reflash the TK-II's PIC chip with the latest firmware release. For more details about this programmer, go to the following link:
