

XL/XE High-Speed SIO OS ROM Replacement

Two ROM images have been provided. One is meant for a 27128 (16K) EPROM, and the other is a dual OS targeted at a 27256 (32K) EPROM. Either one will drop right into a stock Atari XL/XE and give you a High Speed SIO capable OS. However if one is willing to do a mod on their computer by cutting a trace or lifting pin 27 on the EPROM, the dual OS chip can be bank selected via a SPDT switch (perhaps take over the channel select switch for this purpose).
